Dutasteride 0.5mg

Tadalafil 5mg

An innovative combination therapy that provides a single-solution approach to the major challenges in men's health: benign prostatic hyperplasia (BPH), hair loss, and erectile dysfunction (ED).

3 Core Strengths

- Concurrent approach to coexisting symptoms
- Improved patient compliance and convenience
- Ideal for stable, long-term maintenance therapy

Approved for Export by the MFDS

A product that combines the potent effects of dutasteride with tadalafil to alleviate patient concerns.

Dutasteride: Potent DHT Inhibition Mechanism	Reduction in prostate volume, suppression of hair loss progression. • Dutasteride 0.5mg potently inhibits DHT and minimizes its impact on hair follicles, contributing to the suppression of hair loss progression. • It inhibits both type 1 and type 2 5α-reductase, reducing DHT levels by over 90%. [Finasteride reduces DHT by approximately 70%] • Numerous clinical studies have confirmed the efficacy of dutasteride in suppressing the progression of hair loss.
Tadalafil: Improvement of Erectile Dysfunction	• Tadalafil 5mg selectively inhibits the PDE5 enzyme. • This leads to an increase in cyclic guanosine monophosphate (cGMP) levels, resulting in smooth muscle relaxation. • Consequently, blood flow to the corpus cavernosum increases, and improvement in erectile function is expected. • The low-dose, 5mg once-daily therapy has demonstrated sustained efficacy and excellent tolerability in multiple randomized controlled trials. • Its safety in long-term administration has also been established, and sustained blood flow improvement is expected with continuous administration for 6 months or longer.
Active Ingredients	Dutasteride 0.5mg and Tadalafil 5mg fixed-dose combination
Benefits	Indicated for the treatment of symptoms associated with moderate to severe benign prostatic hyperplasia (BPH) with a once-daily oral administration of one tablet.
